EU AI Act self-assessment (1 page)

ForceCRM · local B2B prospect research for Greek food-service businesses · 8 November 2026. This is an engineering self-assessment following the competition brief §9; it is not a legal opinion.

Classification. Clustering businesses for B2B sales is **not an Annex III high-risk use** of Regulation (EU) 2024/1689.

- **The trap:** Annex III point 5(b) makes creditworthiness evaluation or credit scoring of **natural persons** high-risk, and sole proprietorships (ATOMIKH) are natural persons. ForceCRM therefore **never produces a solvency, credit or payment-risk score**.
- Its scores measure only similarity to the user's existing customers. Revenue is used only to weight the user's own customers, never to score prospects.
- Repurposing the system for credit, eligibility or pricing decisions would require a new assessment.
- Per the brief, Annex III obligations were postponed to **2 December 2027** by **Regulation (EU) 2026/1744 (Digital Omnibus on AI)**.

1. What does the system decide or suggest?

- **Suggests only, decides nothing.** It groups the uploaded customers into 1–6 profiles and ranks non-customer businesses by similarity, each with a short justification.
- **A person acts.** A salesperson decides whether to research or contact a business. Nothing is contacted, priced or rejected automatically.

2. Who is affected?

- **The users:** sales staff and the uploading company.
- **The prospects** listed. Sole proprietors among them may be identifiable natural persons.
- **Data minimisation:**
  - The upload is limited to ΑΦΜ and revenue, and everything runs on the laptop.
  - The optional live ΓΕΜΗ check sends only prospect ΑΦΜ (public-registry identifiers) with the user's own key, never the customer list or revenue.
  - Run folders and caches stay local and can be deleted by the user.
  - Demo accounts (username, scrypt password hash) and support tickets are stored only in the local SQLite file.

3. What does the user see about how a result arose?

- **Transparency (Art. 50, applicable from 2 August 2026):** every AI-written text is labelled.
  - In the UI, each AI text carries an «AI · ΤΟΠΙΚΟ ΜΟΝΤΕΛΟ» tag.
  - In profiles.json: ai_generated, description_status and title_source. Each sentence also records its author (local LLM or verified template) and its source fact.
  - The in-app help assistant labels each answer "AI · τοπικό μοντέλο" or "σταθερή απάντηση", and its header warns that answers can contain mistakes.
- **Evidence behind every profile:** counts, revenue share, traits with lift, p-value and q-value, bootstrap stability, fit confidence and the activity mix against the market.
- **Prospect justifications** name the shared traits and the similarity figures. Prospects outside a profile's acceptance radius are marked «Διερευνητική πρόταση».
- **Reproducibility:** generation settings are fixed (temperature 0, seed 42), and model identity, prompt hash and rejected drafts are recorded.

4. Where can it be wrong, and how do we detect it?

Risk	Detection / mitigation
Self-declared ΚΑΔ that aren't really practised	Primary activity ≥ 80% of the activity vector; only related secondaries kept, trusted less the more a business declares, ignored above 20; a human verifies before contact
Invented or wrong text	One sentence per fact; numbers, %, names and wording checked; a failing sentence keeps its verified template
Traits passing by chance	VAT-level Fisher tests, global Benjamini–Hochberg correction, ≥ 5 ΑΦΜ, lift ≥ 1.2; labelled exploratory
Unstable profiles	Per-profile bootstrap Jaccard (mean and worst 10%), ARI; "limited quality" label
Branch leakage or double counting	Counts, holdout and exclusion all per ΑΦΜ; revenue split across branches
Poor ranking	Internal holdout vs the primary-ΚΑΔ baseline (Recall@500/2000, 5 splits)
Over-reliance on scores	Scores are uncalibrated similarity, stated in the UI and description: "not a purchase probability"
Help assistant gives wrong guidance	Answers only from a fixed help text and read-only analysis facts; credit/solvency questions refused without the model; rule-based hand-off to human support (request for a person, problem report, repeated question) plus a permanent support button
Geographic bias	Profiles that are mainly geographic are documented as such; business traits shared across regions are shown separately

AI literacy (Art. 4). The UI section "Πώς λειτουργεί — και πού χρειάζεται προσοχή", the architecture and the model & data card explain the inputs, weights, statistics, model limits and failure modes, so both builders and users know what the system does and where it fails.

Local boundary.

- Serving is loopback-only, and models run locally (Ollama on 127.0.0.1, embeddings offline). No AI service is called at runtime.
- Setup downloads models once.
- The only runtime network call is the opt-in ΓΕΜΗ registry-status check, which fetches data, never AI. Its result never changes scores or ranking.
